

MÖRKER
Mechanical lighting & anti semantics

Mörker is exploring new principles for LED technology by challenging the deep tracks the old lightbulb based designs has left in the industry. The interface is the entire shape since all functions, on/off and dimming, are controlled mechanically by turning the luminaire, a black box. Few hints, low affordance.

The principle is scaleable and can therefore be applied to several situations. Mörker is small and lights small things. Milled out of solid aluminum with plastic reflectors and a light of 1200 lumen (that's quite a lot).
